Job Market Paper

Develop or Conserve? How the US Government Allocates Public Lands

Abstract. In the United States, the federal government owns 30% of the country and half of the Western US. The Bureau of Land Management (BLM), the largest federal land manager, delegates land-use decisions to 175 geographically dispersed field offices. These offices determine where mineral development, which generates billions in public revenue annually, can proceed and where development is restricted for conservation. Federal law dictates that field offices (i) make decisions to maximize federal land's market and non-market resource values, and (ii) publicly justify their choices to stakeholders. However, field offices maintain significant discretion in how to value nonmarket resources and how to reconcile competing demands from conservation and industry stakeholders. I show that field offices' land-use decisions can be modeled as many discrete choices and use this framework to transform 90,000 pages of planning records across 11 field offices into data suitable for discrete-choice econometric methods. I then estimate how much revenue each office would forgo to (i) conserve non-market resources and (ii) follow established conservation standards rather than justify departing from them to stakeholders. I find that the median office is willing to forgo $60,000 in annual revenue to conserve one acre. These valuations vary substantially across offices and non-market resources. Suggestive evidence indicates that differences in local preferences better explain this heterogeneity than differences in environmental damages from development. In seven out of ten decisions, the median office passes up higher net resource benefits to remain closer to an established standard. Counterfactual analyses show that heterogeneous conservation valuations and preferences for established standards jointly shape the relative cost-effectiveness of federal conservation policy instruments and the spatial distribution of the induced conservation.

Working Papers

Empirical Tests of the Green Paradox for Climate Legislation

with Wolfram Schlenker · *Revise & resubmit, Journal of Public Economics*

Abstract. The Green Paradox posits that fossil fuel markets respond to evolving expectations about climate legislation, intended to limit future consumption, by shifting consumption to the present, lowering present-day prices. We demonstrate that oil futures reacted negatively to daily changes in prediction market expectations regarding the Waxman-Markey bill—the U.S. climate bill discussed in 2009–2010. This effect is observed across various maturities, with an even larger impact on more distant maturitiesis;, consistent with the Green Paradox prediction that the proposed legislation would have reset the *entire* price and consumption path temporary supply or demand shocks would phase out over time. The decrease in oil prices is accompanied by a decrease in storage levels as consumption accelerates while it takes time for new production to come online. Furthermore, two unexpected court rulings that implied limited future fossil fuel use were also

associated with negative abnormal oil future returns. Taken together, these findings confirm that restricting future fossil fuel use accelerates current-day consumption. The passage of the Waxmann-Markey bill would have increased current global oil consumption by 2%.

The Importance of Earnings from Recycling

Abstract. Recycling—collecting discarded items and redeeming their scrap value—channels income to marginalized populations. This paper evaluates the importance and prevalence of these earnings throughout the US. Specifically, this paper shows that positive shocks in recycling earnings increase household food expenditures and improve birth outcomes. Bottle bills—a policy requiring refundable deposits on beverage containers—boost food expenditures by approximately 10.2%, increasing recycling earnings by roughly $1400/year (in 2015 dollars)—an amount achievable by collecting 38 containers per day during the sample period. The effect is concentrated among low-income, able-bodied households—a population likely to recycle for cash. Moreover, increases in recycling earnings improve birth outcomes—a proxy for economic well-being in low-income populations. Back-of-the-envelope calculations imply that informal recycling markets are 50% as effective as food stamps at reducing the incidence of low birth weight. The striking comparability between recycling earnings and a targeted welfare program can be explained by both the size of recycling-generated income and the distinct populations each income source reaches.

Selected Work in Progress

Tracing the Formation and Origins of Standards in Environmental Review
with Simon Greenhill

Weather Volatility, Food Waste and Firm Adaptation
with Roberto Zúñiga

Awards & Grants

CEEP Student Research Grant, Columbia University 2024, 2026
Dean's Fellow, Columbia University 2021–2026
Wu Fellow, Columbia University 2021–2022
Hughes Family Fellow in Environmental Studies, Bowdoin College 2016

Research Positions

Graduate Fellow, New York City Department of Sanitation (DSNY) 2023–2024
Forecast organic waste generation; forecasts set the basis for the city's compost-processing auctions.
Research Assistant to Wolfram Schlenker, Columbia University 2022–2024
Pre-Doctoral Fellow, Climate Impact Lab 2018–2020

Teaching

Teaching Assistant, Columbia University's School of International and Public Affairs
Environmental Science for Sustainable Development (Ph.D.) Fall 2024, 2025, 2026
Microeconomics for Public Policy II (MPA) Spring 2025

Conferences, Service & Languages

Conferences: AERE Summer Conference (2024), AERE@OSWEET (2024), Heartland Workshop (2025)
Service: Sustainable Development Colloquium Organizer (Fall 2022, Spring 2023, Fall 2025)
Languages: English (native), Spanish (proficient)
